Conclusion	12

Introduction

Privacy Recsys is a system that utilizes privacy preserving approaches to deliver privacy preserving recommendations. The current implementation supports recommendations of Movies based on either the historical ratings (as an independent system) or based on the search queries of the user at the Searx search engine.

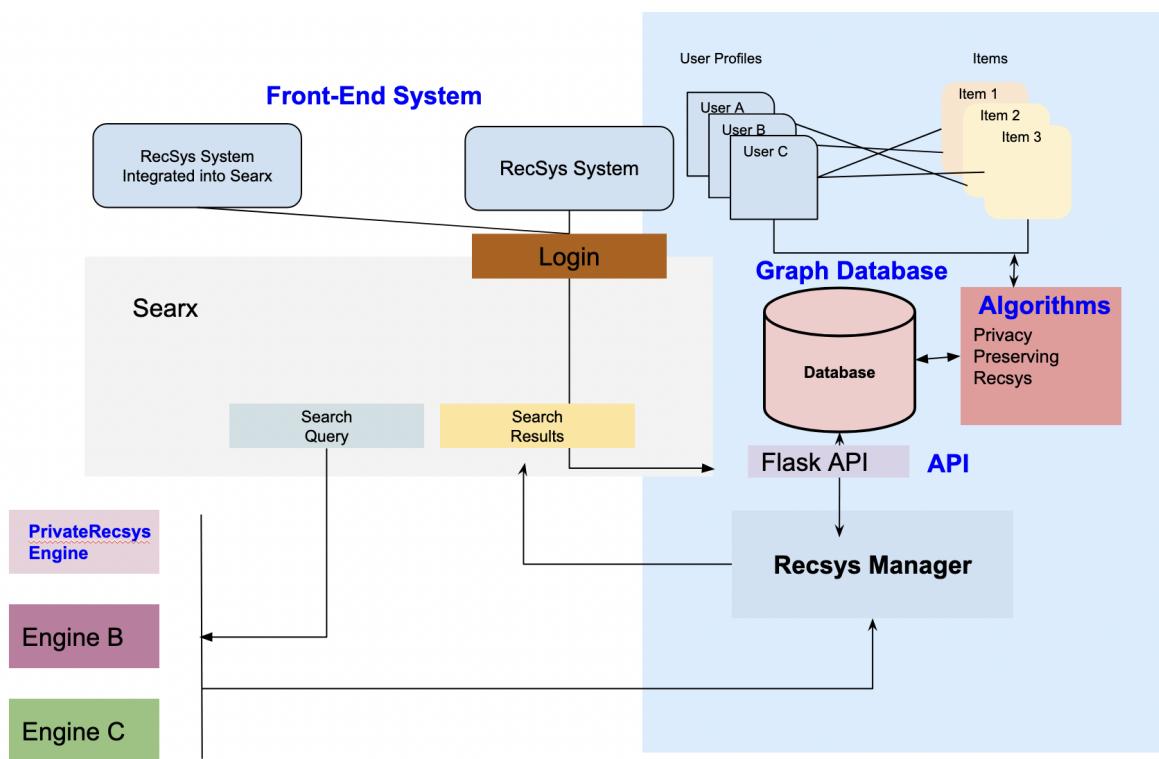

This deliverable presents the PrivateRecsys system as a standalone and as an integration into Searx. For both implementations, the system architecture, the components and functionality are presented. Also this deliverable provides a User Manual guide - presenting how to build and run the systems.

The deliverable concludes with steps for the future work section consisting of ideas for further expanding the system and underlines the improvements to be undertaken for PrivacyRecsys.

This guide can be useful to anyone interested in using or extending the PrivateRecSys project, integrating the system to other applications or building other integrations for the Searx system.

PrivacyRecsys System Architecture

The PrivateRecsys system was developed to deliver recommendations while respecting the privacy of the user. Important components are the graph database which holds the entities and the relationships between them, the privacy preserving algorithms and the front end. This section presents the architecture of the system and provides an analysis of the components.

PrivacyRecSys Components Analysis

Differential Privacy based recommendations.

Differential privacy aims to provide means to maximize the accuracy of these statistical queries while minimizing the chances of identifying its records. It introduces noise to real data so that, adding or removing one user to database does not make noticeable difference in the data, thus preventing to identify his/her private information. It is a probabilistic concept, therefore, any differentially private mechanism is necessarily randomized with Laplace mechanism, exponential mechanism etc.

Let ϵ be a positive real number and A be a randomized algorithm that takes a dataset as input (representing the actions of the trusted party holding the data). The algorithm A is ϵ -differentially private if for all datasets D_1 and D_2 that differ on a single element (i.e., the data of one person), and all subsets S of image of A .

$$\Pr[A(D_1) \in S] \leq e^\epsilon \times \Pr[A(D_2) \in S]$$

where the probability is taken over the randomness used by the algorithm.

Differential privacy is used in this implementation of the privacy recsys to preserve the privacy of the users and make sure that no one can determine the exact rating a user provided to a movie, or what movies a user has rated.

Experimental Results

To measure the error of the recommendation algorithm, and determine the privacy/utility ratio of the recommendation we undertake a small evaluation based on the query "What is the number of ratings given to a movie? (movie name as parameter) considering all the data in our dataset" is shown. This is the fundamental question for testing the effectiveness of differential privacy - according to which you should never be able to determine how many users have contributed for this rating and therefore removing all ratings -1 will not return the rating of the one user that remained. The Algorithm is run three times and all results are included to the table. The difference in the results is attributed to the randomness of the algorithm, and the application of differential privacy as noise.

Movie ID	Actual Rating Count	Noisy Rating Count (exp-1)	Noisy Rating Count (exp-2)	Noisy Rating Count (exp-3)
5	51	61.53068160858365	4.14780634816978	45.74972097598749
8	8	23.754713618664823	4.5610873458316625	-30.184266258323568

11	72	80.61785730156829	68.2613306805804	90.99006185916669
210	4	12.93616669892703	-1.441247061146698	-26.601274325745656

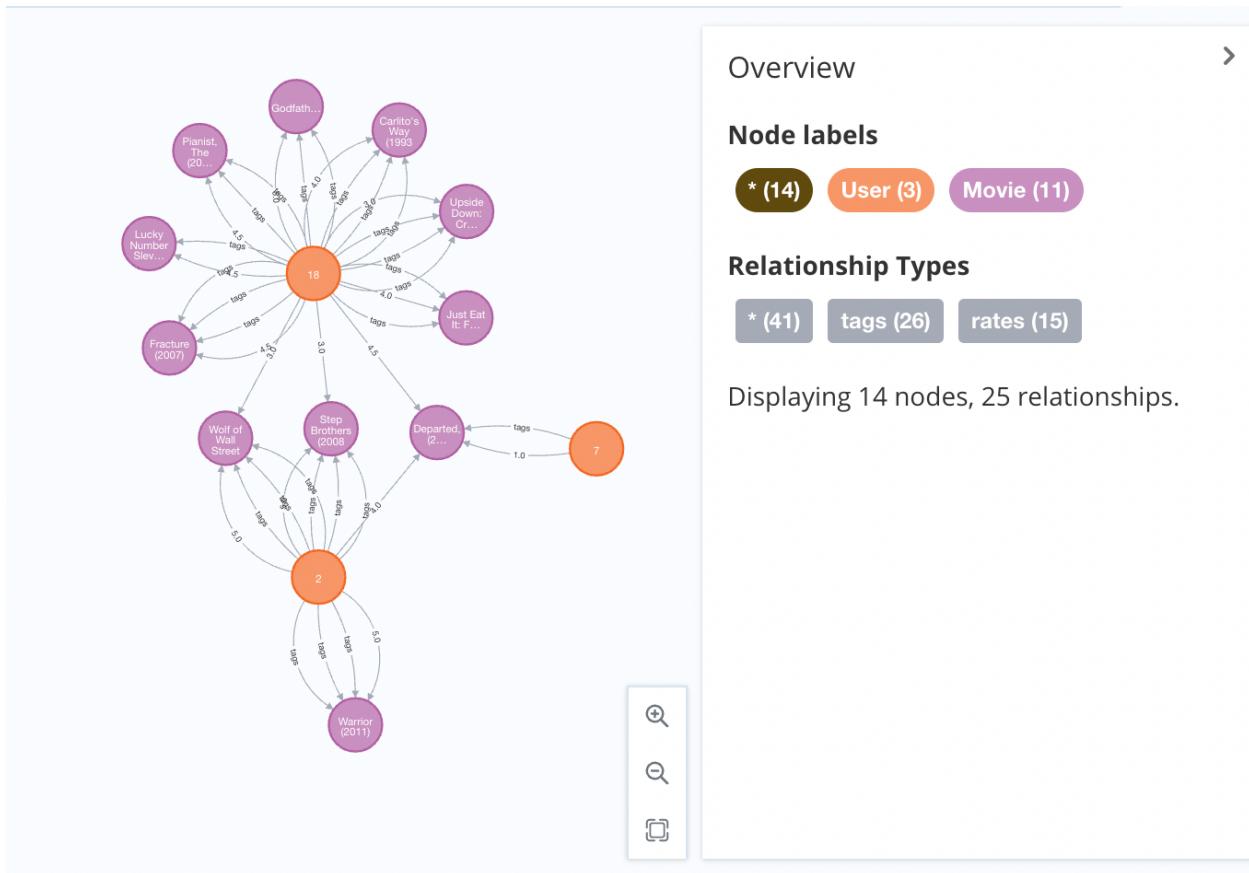

Graph database

A graph database (GDB) is a database that uses graph structures for **semantic queries** with nodes, edges, and properties to represent and store data.¹⁴ A key concept of the system is the graph (or edge or relationship). The graph relates the data items in the store to a collection of nodes and edges, the edges representing the relationships between the nodes. The relationships allow data in the store to be linked together directly and, in many cases, retrieved with one operation. Graph databases hold the relationships between data as a priority. Querying relationships is fast because they are perpetually stored in the database. Relationships can be intuitively visualized using graph databases, making them useful for heavily interconnected data

In the implementation of PrivacyRecsys the [Neo4J](#) graph database is used, to store the data regarding the users and the items, and also semantically annotate the relationships between them. We use the relationship “rated” to connect Users and Items (in the case of the example used “Movies”).

Beyond Neo4J being a graph database, which makes it ideal for this project, also offers free-usage remote sandboxes which you can use to make the database you are working available to the web so other people can test it.

The system was developed based on a publicly available and free to use movies dataset.

API

API which stands for Application Programming Interface os concept that applies everywhere from command-line tools to enterprise code, microservices, and cloud-native architectures.. An API is an interface that software developers use to programmatically interact with software components or resources outside of their own code. An even simpler definition is that an API is the part of a software component that is accessible to other components.

PrivacyRecsys utilizes an API to make the usage of the database and algorithms accessible to the User Interface and also make them available for other systems to use.

In particular, we used **FLASK** and **Swagger** for developing the API and we made it available as a website where other developers can find the documentation and also test it. **Flask** is a micro web framework written in Python. It is classified as a microframework because it does not require particular tools or libraries.

Flask is a widely used micro web framework for creating APIs in Python. It is a simple yet powerful web framework which is designed to get started quick and easy, with the ability to scale up to complex applications.

Swagger is a suite of tools for **API developers** from SmartBear Software and a former specification upon which the OpenAPI Specification is based. Using Swagger you can **build, document, test and consume RESTful web services**. It can be used with both a top-down and bottom-up API development approach. In the top-down, or design-first, method, Swagger can be used to design an API before any code is written.

The PrivateRecsys API supports functionality related to users, movies and search queries.

Allows a user to login, register and get the user profile, for movies the user get all movies, only those rated by the user, recommended and similar movies, rate and delete a rating for a movie, and also receive similar movies based on a text query.

The screenshot shows the Swagger UI for the PrivateRecsys API. At the top, there's a green header bar with the title "PrivateRecsys" and the URL "http://127.0.0.1:5000/api/swagger.json". On the right side of the header is a "Explore" button. Below the header, the main content area is titled "PrivacyRecsys Demo API".

The API is organized into three main sections:

- users**: This section contains three operations:
 - POST /api/v0/login**: Labeled "Login".
 - POST /api/v0/register**: Labeled "Register a new user".
 - GET /api/v0/users/me**: Labeled "Get your user".
- movies**: This section contains eight operations:
 - GET /api/v0/movies**: Labeled "Find all movies".
 - GET /api/v0/movies/rated**: Labeled "A list of movies the authorized user has rated."
 - GET /api/v0/movies/recommended**: Labeled "A list of recommended movies for the authorized user."
 - GET /api/v0/movies/{id}**: Labeled "Find movie by ID".
 - DELETE /api/v0/movies/{id}/rate**: Labeled "Delete your rating for a movie".
 - POST /api/v0/movies/{id}/rate**: Labeled "Rate a movie from".
 - GET /api/v0/similarmovies/{movie_id}/**: Labeled "Find all movies".
 - GET /api/v0/similarmoviesthread/{query}/**: Labeled "Find all movies".
- Search Queries**: This section contains four operations:
 - GET /api/v0/queries**: Labeled "Find all Queries".
 - GET /api/v0/queries/me**: Labeled "A list of queries the authorized user has made."
 - DELETE /api/v0/queries/{id}**: Labeled "Delete your search".
 - POST /api/v0/queries/{id}**: Labeled "Save a query and associate with a user".

At the bottom left of the content area, there's a note: "[BASE URL: , API VERSION: 0.0.1]".

The PrivateRecsys API currently support the required functionality of both the PrivacyRecsys system as a stand alone, but also as an integration into Searx.

The API can be further expanded to support more items like news articles, items to buy, places, restaurants etc.

Example Query on the PrivacyRecsys Demo API

The screenshot shows the API documentation for the PrivacyRecsys Demo API. The URL is `/api/v0/similarmovies/{movie_id}/`. The response class is `Status 200`, returning a JSON object with fields: duration, id, my_rating, poster_image, rated, released, summary, and tagline. The response content type is `application/json`. A parameter `movie_id` is defined with value `13`. The curl command to execute the request is `curl -X GET --header 'Accept: application/json' 'http://localhost:5000/api/v0/similarmovies/13/'`. The request URL is `http://localhost:5000/api/v0/similarmovies/13/`. The response body contains two movie objects with null values for most fields except title. The response code is `200` and the response headers include content-length: 4093 and content-type: application/json.

Implementation Notes
Returns a list of movies

Response Class (Status 200)
All movies

Model Example Value

```
[  
  {  
    "duration": 0,  
    "id": "string",  
    "my_rating": 0,  
    "poster_image": "string",  
    "rated": "string",  
    "released": "string",  
    "summary": "string",  
    "tagline": "string",  
  }  
]
```

Response Content Type `application/json`

Parameters

Parameter	Value	Description	Parameter Type	Data Type
<code>movie_id</code>	<code>13</code>	The id of the movie	path	string

Try it out! [Hide Response](#)

Curl

```
curl -X GET --header 'Accept: application/json' 'http://localhost:5000/api/v0/similarmovies/13/'
```

Request URL

```
http://localhost:5000/api/v0/similarmovies/13/
```

Response Body

```
[  
  {  
    "duration": null,  
    "id": "115",  
    "my_rating": null,  
    "poster_image": null,  
    "rated": null,  
    "released": null,  
    "summary": null,  
    "tagline": null,  
    "title": "Big Lebowski, The (1998)"  
  },  
  {  
    "duration": null,  
    "id": "674",  
    "my_rating": null,  
    "poster_image": null,  
    "rated": null,  
    "released": null,  
    "summary": null  
  }  
]
```

Response Code

```
200
```

Response Headers

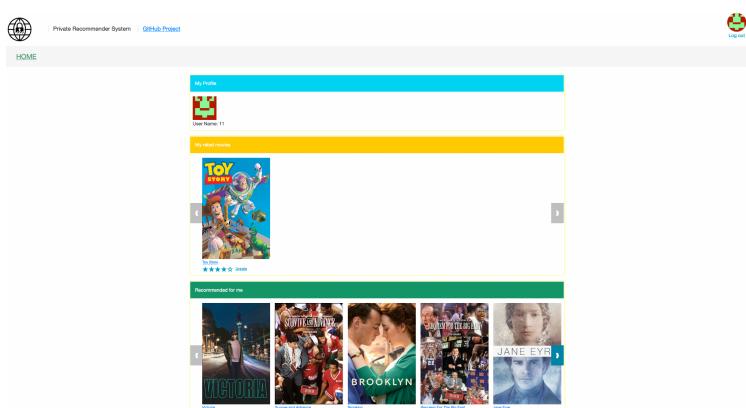

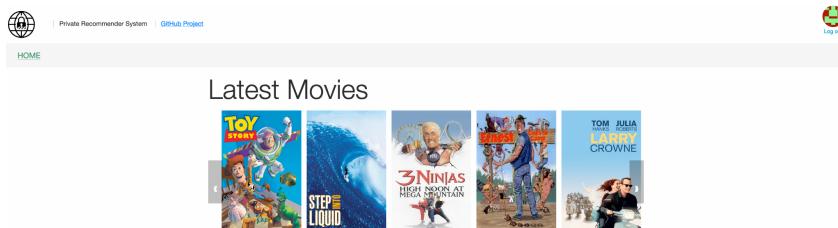

```
{  
  "content-length": "4093",  
  "content-type": "application/json"  
}
```

Front End - PrivacyRecsys System

For the front-end of this web-based system React Js was used. **React** is a free and open-source front-end JavaScript library for building user interfaces based on UI components. It is maintained by Meta and a community of individual developers and companies. **Bootstrap css** was also used for styling and formulating the website.

The implemented system allows a user to register and login, rate movies and receive recommendations based on previous ratings . The system considers both item-based and collaborative-filtering recommendations to suggest items to the user.

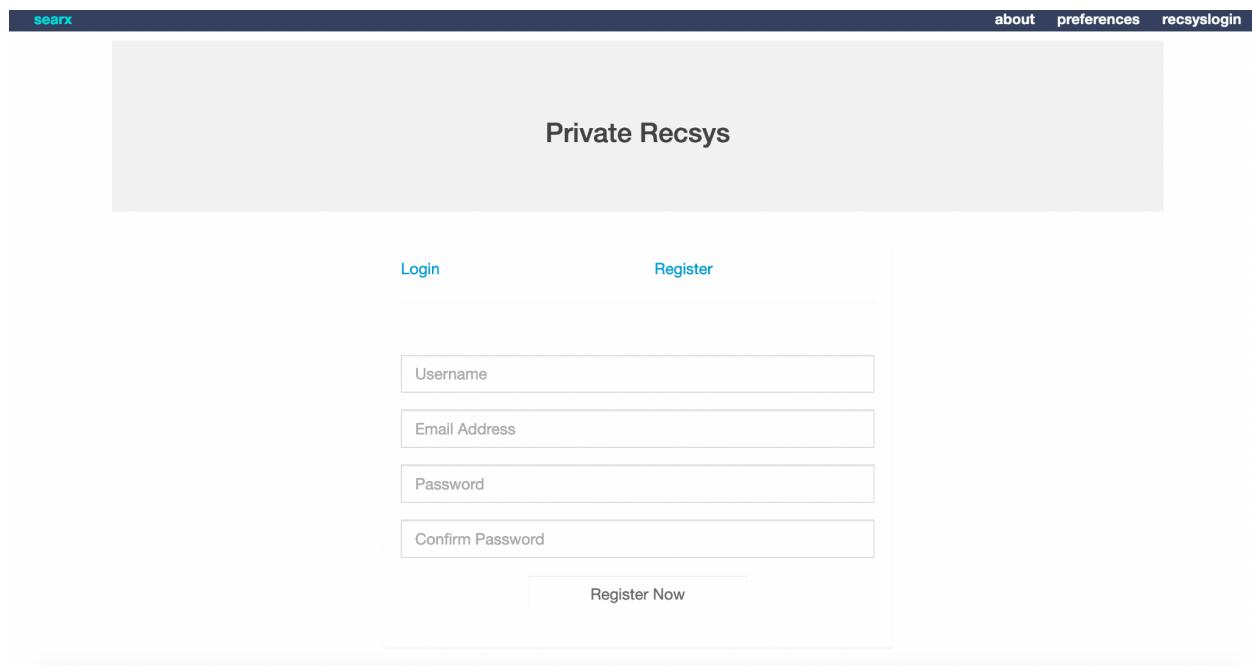

Screenshots from the Recsys System are available below.

A screenshot of the "Log in" page. It features a title "Log in" at the top, a note "Not registered yet? [Sign up](#)", and two input fields for "User name*" and "Password*". Below these fields is a blue "Log In" button. At the bottom of the form, there is a link "Forgot [password?](#)".

Front End - Integrated in Searx

For the front-end of integration of the PrivacyRecsys into Searx HTML, Python, and JSS was used.

As a first step, a new menu item was added on the top bar to allow the privacy recsys login.

After login in the user can see its profile, which consists of all the searches a user made as well as all the movies he has rated in the past. The user is allowed to remove any of the items in order not to be further considered in recommendations.

A logged-in user will receive movie recommendations on the left hand side, but also when he presses the **PrivateRecsys** category that was installed on the search engine. By pressing in the category the user will receive recommendations.

If the user is not logged in, or does not have a profile, the user will receive recommendations based on the current query only.

Recsys engine - Searx

The recsys engine was implemented into Seacx using Python and serves as a middle-ware between Searx and the PrivacyRecsys components. Through the engine, the user profile is identified, the queries are saved into the user profile and all the interaction with the database and the privacy recsys algorithms is implemented.

Conclusion

This deliverable presented the architecture, and the various components of the PrivateRecsys system as a standalone and as an integration into Searx. This documentation shall assist further expansions of the system and improvements, as well as in the developments of other projects and integrations for the Searx engine.

The PrivacyRecsys system is far from being perfect and can be expanded in various ways. We hereby list some of the improvements that can be made to improve its usability and effectiveness.

- 1) Encrypted database and privacy-preserving API: Although the algorithms for retrieving data from the database and making recommendations of users are privacy preserving, the database still holds all the data and can be violated and hacked to exploit user data. A graph-based, yet encrypted database supported by a similar privacy preserving API can better ensure data privacy and security.
- 2) User Interface: Given the short duration of this project, not enough effort was paid in making a truly usable and aesthetically pleasing front-end. A better in terms of design, user interaction user interface would allow users to take full advantage of what this system was to offer.
- 3) PrivacyRecsys as a plugin for a browser or independent browser: The integration into searx was a proof-of-concept of the integrability of the components. However, this is restricted in only utilizing search queries and depending on existing search engines (google, bing etc) to provide results. A plugin for a browser, or an independent browser would be better suited for truly privacy preserving recommendations in various domains.
